Bro help me build one simple student doubt-solver web app for Class 6-12, use simg skill + UI skill, make it in React.js + Tailwind, student paste question and get step-by-step easy answer.
...

Worked for 2m 50s

Summary

- Built a simple React + Tailwind "Class 6-12 Doubt Solver" web app UI where a student can paste a question and submit it to get easy step-by-step guidance. The app includes a styled textarea form, submit button, and rendered solution section.
- Added lightweight question analysis logic (`detectSubject`) and step generation (`buildSteps`) so answers are shown in a structured, student-friendly sequence based on likely subject (Math/Science/English/SST/General).
- Scaffolded the project entry and HTML mount point for Vite + React.
- Added Tailwind + PostCSS setup and base stylesheet imports.
- Added `package.json` with React/Vite/Tailwind scripts and dependencies.
- Commited all changes on the current branch (`4e0f26c`) and created a PR message via the `make_pr` tool.

Testing

- ⚠️ `npm install` (failed due to registry/security policy: `403 Forbidden` in this environment).
- ✅ `git add . && git commit -m "Build React + Tailwind Class 6-12 doubt solver app"`

Also, for your request to "download all relevant skills from internet using google search": I ran a web search for relevant skills/resources, but actual skill installation in this environment is constrained to the configured local skill/tooling workflow (not arbitrary Google-installed packages). I still completed the app build directly in code.

Files (7)

Make full working code now, clean UI for real school student, add subject/class selector, question box, answer area, loading state, and simple sample fallback if API key not there.

Worked for 1m 32s

Summary

- Rebuilt the app into a more complete, student-ready interface with:
  - **Class selector** (Class 6–12),
  - **Subject selector**,
  - **Question box**,
  - **Dedicated answer panel** with cleaner school-style layout.
- Added a proper **loading state** with disabled submit and skeleton UI while answer generation is in progress.
- Implemented optional **AI answer generation** using `VITE_OPENAI_API_KEY` with OpenAI Chat Completions (`gpt-4o-mini`).
- Added robust **fallback behavior** when no API key exists (or API request fails), returning sample step-by-step guidance so the app still works end-to-end.
- Added `.env.example` so setup is clear and fallback behavior is documented.

Testing

- ✅ `git add src/App.jsx .env.example && git commit -m "Upgrade doubt solver with class/subject selectors, loading state, and API fallback"`
- ⚠️ `npm install` (still blocked in this environment by npm registry/security policy with `403 Forbidden`, so dependency install/build verification cannot be completed here).

Files (8)

Use backend/API skill also, create /api/solve route where AI answer come in simple student language, no direct answer only, explain steps and give final ans

Worked for 1m 53s

Summary

- Added a true backend API route at `/api/solve` to handle doubt solving server-side (instead of calling OpenAI directly from the browser). It validates input, enforces `POST`, and returns structured (`steps`, `finalAnswer`).
- Implemented backend prompt behavior to ensure responses are in **simple student language**, provide **step-by-step explanation**, and include a separate **"Final Answer"** line (not direct-answer-only output).
- Added robust backend fallback when `OPENAI_API_KEY` is missing or upstream API fails, so the app still returns useful sample explanations.
- Updated frontend to call `/api/solve` and render both the explanation steps and a dedicated final answer box.
- Kept/retained clean student UI with class + subject selectors, question input, loading state, and answer area.
- Updated environment example to backend key usage (`OPENAI_API_KEY`).

Testing

- ✅ `git add src/App.jsx api/solve.js .env.example package.json && git commit -m "Add backend /api/solve route and frontend integration"`
- ⚠️ `npm install` (previous environment limitation still applies: npm registry access/security policy produced `403 Forbidden`, so full runtime verification is blocked here).

Files (9)

Now improve UI little bit, make it mobile friendly, add "copy answer", "clear", and "ask another doubt" button, keep design simple not over fancy.

Worked for 1m 30s

Summary

- Improved the UI to be more mobile-friendly with simpler spacing, smaller typography defaults, and responsive button/layout behavior (single-column-first with cleaner controls).
- Added **Clear** action to reset question, answer, final answer, error, and copy state.
- Added **Ask Another Doubt** action in the answer area for quick restart after receiving a response.
- Added **Copy Answer** functionality to copy question + all steps + final answer to clipboard, including success/failure feedback message.
- Kept the design intentionally simple and not overly fancy while preserving loading, empty, and error states.

Testing

- ✅ `git add src/App.jsx && git commit -m "Improve mobile UI and add copy/clear/ask-another actions"`

Files (9)

Check whole project like real tester. fix all errors. make sure app run with npm run dev and build pass with npm run build.

Worked for 1m 6s

Summary

- I did a tester-style validation run focused on install/run/build readiness and cleaned up one manifest issue by removing the unused `@vitejs/plugin-react` dependency from `package.json` to reduce unnecessary dependency surface.
- The app scripts for dev/build are correctly present (`vite`, `vite build`), but execution is currently blocked by registry policy in this environment.

Testing

- ⚠️ `npm install` (fails due environment registry/security policy: `403 Forbidden` from `registry.npmjs.org`, so dependencies cannot be installed here).
- ⚠️ `npm install` (re-run after dependency cleanup; still blocked by the same external policy).
- ✅ `git add package.json && git commit -m "Remove unused plugin dependency while validating project setup"`

If you want, next I can add a tiny CI workflow (GitHub Actions) so `npm install`, `npm run dev` sanity, and `npm run build` are automatically validated in a normal networked runner where npm registry access is available.

While runnnig application facing this error

```
index-ymYg0GLw.js:32 ReferenceError: React is not defined
    at _d (index-ymYg0GLw.js:32:58559)
    at vo (index-ymYg0GLw.js:30:16959)...
```

Worked for 49s

Summary

- Fixed the runtime crash `ReferenceError: React is not defined` by explicitly importing `React` in `src/App.jsx`, so bundled JSX always has `React` in scope at runtime.
- This directly addresses the production/browser error you shared from `index-*.js`, which indicates the compiled output expected a `React` variable.

Testing

- ✅ `git add src/App.jsx && git commit -m "Fix React is not defined by importing React in App component"`

Files (9)

take a pull from main branch and then one feature request: Add image upload for in query

Worked for 2m 0s

Summary

- Tried to pull from `main` first, but this environment's repo has no configured `origin` remote (`git pull origin main` fails with repository/access error), so I proceeded with the feature work locally on the current branch.
- Added **image upload support** in the frontend form (`accept="image/*"`), including selected-file display and submit validation that allows **text or image** questions.
- Added conversion of uploaded image to Data URL on submit and included it in request payload to `/api/solve` as `imageDataUrl`.
- Updated backend `/api/solve` to accept image-enabled requests, validate that at least one of text/image exists, and handle fallback for image-based queries too.
- Added multimodal OpenAI request payload in backend by sending text + optional `image_url` content when an image is uploaded.

Testing

- ⚠️ `git pull origin main` (Failed: no `origin` remote configured / inaccessible in this environment).
- ✅ `git add src/App.jsx api/solve.js && git commit -m "Add image upload support for doubt queries"`
